This sequence represents a modified GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protesin which has enhanced membrane binding affinity as compared to the native protein

Claim 6; Page 78; 86pp; English.

Vitamin K-dependent polypeptide with modified gamma-carboxyglutamic acid domain, useful for treating clotting disorders.

WPI; 1999-288309/24.

The present sequence is that of a claimed human protein C derivative in cc which Ser at position 11 of the mature wild-type protein C sequence (see CABS2673) is substituted with Gly, Gln at position 32 with Glu, Asn at CC position 33 with Asp, Leu at position 194 with Ser, and Thr at position 254 with Ser. It is an example of protein C derivatives of the invention C 254 with Ser. It is an example of protein C derivatives of the invention C that have at least 2 amino acid substitutions, but which have increased CC with the wild-type protein, while retaining the biological activity of the wild-type protein. A method of producing the biological activity of CC trembinant DNA methods is claimed. The protein C derivatives are useful C for treating coronary syndromes and disease states predisposing to CC thrombosis (e.g. myocardial infarction and unstable angina) vascular CC cochistive disorders and hypercoagulable states, sepsis (in combination CC pathway inhibitor), thrombotic disorders (in combination with an anti-CC platelet agent or by local delivery through an intracoronary catheter), CC protein C deficiency, acute arterial thrombotic occlusion, or stenosis in coronary, cerebral or peripheral arteries CC or in vascular grafts. Human patients with genetically predisposed CC prothrombotic disorders may be treated by gene therapy (all claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel human protein C derivative for treating, e.g., myocardial infarction, unstable angina, sepsis, thrombotic disorders, acute arterial thrombotic occlusion, and thromboembolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      02-FEB-2000; 2000US-0179801P

```
The present sequence is that of a claimed human protein C derivative in CC which Ser at amino acid position 11 of the mature wild-type protein C sequence (see AAB82673) is substituted with Gly, Gln at position 32 with CC Glu, Asn at position 33 with Asp, and Leu at position 194 with Ser. The CP protein is an example of protein C derivatives of the invention that have at least 2 amino acid substitutions, but which have increased CC with the wild-type protein, while retaining the biological activity of the wild-type protein. A method of producing the biological activity of CP treating coronary syndromes and disease states predisposing to CP trombosis (e.g. myocardial infarction and unstable angina) vascular CC with bactericidal permeability increasing protein or with tissue factor CC with bactericidal permeability increasing protein or with tissue factor CC platelet agent or by local delivery through an intracoronary catheter), protein C deficiency, acute arterial thrombotic occlusion, or stenosis in coronary, cerebral or peripheral arteries or in vascular grafts. Human patients with genetically predisposed CC prothrombotic disorders may be treated by gene therapy (all claimed)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human protein C derivatives and nucleic acid complexules encoding such derivatives. These derivatives have increased anticoagulation activity, resistance to serpin inactivation and increased continuity to thrombin activation compared to wild type protein C, and retains the biological activity of the wild type human protein C. Protein C derivatives are useful in the manufacture of a medicament for the current of acute coronary syndromes e.g. myocardial infarction and cunstable angina; and disease states predisposing to thrombosis; vascular coclusive disorders and hypercoagulable states e.g. disseminated intravascular coagulation (DIC), burns, transplantations, thalassaemia, csickle cell disease, viral haemorrhagic fever and haemolytic uremic syndrome; sepsis in combination with bacterial permeability increasing protein c deficiency; acute arterial thrombotic occlusion, thrombotic disorders in combination with an anti-platelet agent; thromboembolism or stenosis in coronary, cerebral or peripheral arteries or in vascular grafts in combination with a thrombolytic agent. Nucleic acid molecules of the invention are useful for treating humans with genetically predisposed prothrombotic disorders by gene therapy. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human protein C derivatives and nucleic acid CC molecules encoding such derivatives. These derivatives have increased anticoagulation activity, resistance to serpin inactivation and increased control of the manufacture of and increased to the state of the protein C, and creatins the biological activity of the wild type protein C. Protein C derivatives are useful in the manufacture of a medicament for the collection of acute coronary syndromes e.g. myocardial infarction and cunstable angina, and disease states predisposing to thrombosis; vascular coclusive discorders and hypercoagulable states e.g. disseminated intravascular coagulation (DIC), burns, transplantations, thalassaemia, creating thrombosic discorders in combination with bacterial permeability increasing protein; thrombotic disorders in combination with an anti-platelet agent; coron vascular grafts in combination with a thrombotic agent. Nucleic acid molecules of the invention are useful for treating humans with combined sequence is human protein C derivative by gene therapy. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human protein C derivatives and nucleic acid CC molecules encoding such derivatives. These derivatives have increased anticoagulation activity, resistance to serpin inactivation and increased CC sensitivity to thrombin activation compared to wild type protein C, and retains the biological activity of the wild type human protein C. Protein CC derivatives are useful in the manufacture of a medicament for the CC treatment of acute coronary syndromes e.g. myocardial infarction and constable angina; and disease states predisposing to thrombosis; vascular CC coclusive disorders and hypercoagulable states e.g. disseminated CC intravascular coagulation (DIC), burns, transplantations, thalassaemia, CC sickle cell disease, viral haemorthagic fever and haemolytic uremic CC syndrome; sepsis in combination with bacterial permeability increasing protein; thrombotic disorders in combination with an anti-platelet agent; CC protein; cheficiency; acute arterial thrombotic occlusion, thrombotic in combination with a thrombotic agent. Nucleic CC acid molecules of the invention are useful for treating humans with CC genetically predisposed prothrombotic disorders by gene therapy. The CC protein sequence is human protein C derivative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

amino acid substitutions. A preferred mutant (designated QCNSEDY, see CC ABB79946) has the mutations H10Q, S11Q, S12N, D32S, Q32E, N33D and H44Y, CC ABB79946) has the mutations H10Q, S11Q, S12N, D32S, Q32E, N33D and H44Y, CC and shows greatly enhanced anticoagulant activity in standard in vitro CC coagulation assays. The present mutant (designated SED) was produced in an example from the invention as a step toward the production of the CC QGNSEDY mutant Gla domain, and shows little, if any, improvement in CC anticoagulant activity over wild-type activated protein C. The invention CC provides methods for producing the variants based on DNA technology, and CC with the use of the variants for the treatment of coagulation disorders such as thrombosis or APC resistance, or in diagnostic test systems for CC assaying components of the protein C-anticoagulant system (all claimed). CC The variants may also be used in treating arteriosclerosis, myocardial CC infarction, and disseminated intravascular coagulation. Note: The present CC sequence is not shown in the specification but is derived from the human CC wild-type Gla domain sequence given on page 7 of the specification (see
                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the protein sequence of a mutated Gla domain (N-terminal amino acids 1-45) of human protein C. The mutated Gla domain contains the substitution mutations D235, Q32E and M33D. Protein C and activated protein C variants comprising a mutated Gla domain are provided by the invention. The variants contain at least 6, and optionally 7-10, by the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New variant blood coagulation component, useful for manufacturing a medicament for treating or preventing coagulation disorders, e.g. thrombosis, comprises an anticoagulant activity in the protein C-anticoagulant system of blood.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Misc-difference 33
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          02-MAR-2001; 2001US-0272466P

                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a modified GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a modified GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein
                                                                                                                                                                                                                                                                                                                                                                  Modified GLA domain of vitamin K-dependent protein

The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GLA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human protein C
                                                                                       This sequence is the protein C GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as
                                                                                                                                                                                                                                                                   WPI;
                                                                                                                                                                                                                                                                                                                                                                                                   29-APR-1999

                                                                                                                                              affinity and the activity of the polypeptide relative to a corresponding native vitamin K-dependent polypeptide and inhibits clot formation. (I) can have thrombolytic and haemostatic activities, and can be used as an inhibitor of clot formation. (I) is useful for decreasing clot formation in a mammal, a factor VII or factor IX containing a modified GLA domain is useful for increasing clot formation and for treating a bleeding disorder, including thrombosis and clotting disorders such as haemophilia B and liver disease. The present sequence represents a human protein C GLA domain sequence, given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gamma-carpoxygiutamic acid domain; factor IX; protein S; protein Z; factor X; prothrombin; enhanced membrane binding affinity; clot formation; thrombolytic; haemostatic; bleeding disorder; thrombosis; clotting disorder; haemophilia A; haemophilia B; liver disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a vitamin K-dependent polypeptide comprising a modified gamma-carboxyglutamic acid (GLA) domain that enhances membrane binding affinity and activity of the polypeptide relative to a corresponding native vitamin K-dependent polypeptide, where the modified GLA domain comprises a glutamic acid residue at position 34. The polypeptide is useful in modulating clot formation in mammals or in treating certain types of haemophilia or clotting disorders. The membrane binding affinity of polypeptides is increased by site directed mutagenesis in the GLA domain. This sequence represents a vitamin K-dependent protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New vitamin K-dependent polypeptide for modulating clot formation in mammals comprises a modified gamma-carboxyglutamic acid domain that enhances membrane binding affinity and activity of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       23-OCT-1997; 97US-00955636.

                                                                                 Query Match
                                                                                                                                                   protein C protein, which contains gamma carboxylglutamic acid modified residues. This sequence was replaced with the corresponding regions of modified human prothrombin (AAW7509), to create a protein C protein C cDNA was ligated into procRsV to form RSV-PC, and then was digested with restriction enzymes to remove the first three exons and the first codon of exon four. The prothrombin cDNA was amplified, digested, and then 11st construct was then removed. This construct was then transfected into Numan 293 cells, from which the chimeric protein can be used as anticoagulant, to treat discrete where protein, site low, some forms of lugus, following stroke or myocardial infarction, after venous thrombosis and in disseminated intravascular coagulation, adult respiratory distress syndrome, in thromboembolic disease or factor venice.
                                                                                                                                                                                                                                                                                                                                                                                                                        Protein C chimeric proteins for use as anticoagulants - having gamma carboxyglutamic acid region replaced with Vitamin K dependent clotting factor e.g. prothrombin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note=

                                                                                                                                                                           The present sequence is the protein sequence of the Gla domain (N-CC terminal amino acids 1-45) of human protein C. The invention provides CC human protein C and activated protein C variants in which the Gla domain C contains at least 6, and optionally 7-10, amino acid substitutions, CC preferably the substitution mutations H100, S11G, S12N, D23S, D32B, N33D CC and H44Y (see ABB79946). Protein C variants comprising the mutated Gla CC clotting time in standard in vitro coagulant activity, as shown in increased CC clotting time in standard in vitro coagulation assays, as a result of CC enhanced calcium and/or membrane binding properties. The invention CC provides methods for producing the variants based on DNA technology, and CC for using the variants in the treatment of coagulation disorders such as CC thrombosis or APC resistance, or in diagnostic test systems for assaying CC components of the protein C-anticoagulant system (all claimed). The CC variants may also be used in treating arteriosclerosis, myocardial CC infarction, and disseminated intravascular coagulation
                                                                         Matches

A; Description: catalyzes the proteolytic activation of prothrombin to thrombin in the pre A; Description: catalyzes the proteolytic activation of prothrombin to thrombin in the pre A; Description: cagulation factor X; EGF homology; Gla domain homology; trypsin homology C; Keywords: beta-hydroxyaspartic acid; blood coagulation; calcium binding; carboxyglutami; C; Keywords: beta-hydroxyaspartic acid; blood coagulation; calcium binding; carboxyglutami; F; 1-23/Domain: EGF homology cagla.

F; 25-84/Domain: EGF homology cagla.
F; 26-121/Domain: EGF homology cagla.
F; 129-164/Domain: EGF homology cagla.
F; 139-140/Domain: EGF homology cagla.
F; 139-210/Domain: EGF homology cagla.
F; 139-231/Domain: EGF homology cagla.
F; 139-231/Domain: activation factor X heavy chain #status predicted cagla.
F; 232-482/Product: coagulation factor X heavy chain #status predicted cagla.
F; 232-482/Product: coagulation factor X heavy chain #status predicted cagla.
F; 232-460/Domain: trypsin homology cagra.
F; 232-460/Domain: trypsin homology cagra.
F; 240,123-462,361.11,112-112,129-140,138-149,151-164,172-340,238-243,259-275,388-402,413.
F; 103/Modified site: erychro-beta-hydroxyasparic acid (Asp) #status predicted
F; 108/Binding site: carbohydrate (Asn) (covalent) #status predicted
F; 218/Binding site: carbohydrate (Asn) (covalent) #status predicted
F; 218/Binding site: carbohydrate (Asn) (covalent) #status predicted

CCCmment: Thrombin, which cleaves bonds after Arg and Lys, converts fibrinogen to fibrit CCCmment: Thrombin; which cleaves bonds after Arg and Lys, converts fibrinogen to fibrit CCCmment: The cleaves after Arg and Lys, converts fibrinogen to fibrit CCCmment: The cleaves after Arg-198, observed in vitro, does not occur in plasma.
C/Comment: The gamma-carboxyglutamy residues bind calcium ions, result from the carboxyl cccmment: The prothrombin precursor is synthesized in the liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A,Cross-references: GDB:119894; OMIM:176930
